Abstract
In Gerinco2 project there are a lot of examinations. To store data of examination a new database created with Internet technology. The aim of database is to screen to explore of scoliosis and follow treatment ill of children.

Keywords: scoliosis screening, Internet, MySql, artificial intelligence

1. Method, the structure of database

There are two main parts of database. One of them is the database with its defined structure of a server. The other is a client program for doctors and assistants. The data structure is realized in MySQL¹ system which is free of charge and it is able to serve more users in one time. The structure of database is shown on the Figure 1.

Structure of the database ensures that the data traffic is as low as possible. Because of the used method the system is usable even on a week Internet connection. The pictures are stored on the
server machine. Users download only the needed pictures. The downloaded pictures are stored in the client machine and they downloaded again only the case of changing.

There are four tables in database there. Data institutes and examiners authorized to use the system are stored two separate tables. The system uses different levels of authority and password so everybody can use only his own information.

The data of patients and the examinations are stored in the other two tables. In case of pupils the data of school and the class are stored. There are special identification numbers in the system so the personal identification data are not used. Results of all examinations are in the examination table.

2. Result, the database management software

System specification
Supported operating system: Windows XP
Windows 7
Needed software: MySQL ODBC Connector 5.1
Processor: 1GHz Pentium processor
RAM: 256 MB
Hard disk: 50 MB free space (suggested plus 500 MB for the downloaded pictures)
Display: 1024 x 768 high color, 32-bit
Internet connection is needed for usage of the system.

2.1 Setup and upgrade

\textit{GDB\_setup.exe} program installs the software in an interactive way. The user can define the position of the program in the machine and the Start menu. Default position of the program is C:\Program Files (x86)\GDB\ (Figure 2.)

\textit{Figure 2. The setup dialog}
After setup there is an icon in the Desktop and the Start menu to start the program. The login panel of the program is shown in Figure 3.

After every ten usage the application searches for the newer version on the server. The needed version of MySQL ODBC driver also can be downloaded. After the log in we can use the software. The language of the communication is Hungarian.

2.2 Data of examiners

Data of examiners are username, name, qualification, status, address, phone number, e-mail, authorization, status (Figure 4). Examiners are able to change their own data (Figure 5).
2.3 Data of patients

Panel of patients data has three parts. Name of patients are in the left side. There is a filtering possibility to help the searching process. (Figure 6.)

Data of the selected patient (name, date of birth, name of mother, phone number, address, school, class) are shown in right side on the panel. There are possibilities to change or delete the patients.
User name and place of the examination are the user information as they were defined at login phase.

2.4 Data of examinations

In the right side of dialog we can see the examinations. There is a possibility to choose an examination or create a new one. The selected examination data are shown in the dialog and we are able to modify or delete the data if we have enough rights. (Figure 7.)

![Figure 7. Results of examination](image)

There are a lot of examination can be stored on database: the main data of the patient, X-Ray pictures, moving the hip, moiré and Kinect pictures.

2.4.1 Main data of examinations

The data can be stored are data of left rib hump, right rib hump, left calcaneus, right calcaneus, left knee, right knee, kyphosis, lordosis, shoulder, shoulder point, asymmetry of body-hand, deformity of chest paravertebralis muscle portrusion, left compensation, right compensation, data of legs

![Figure 8. Main data](image)
2.4.2 xRay pictures

Panel of X-Ray there is a possibility to store and analyze the recorded pictures. (Figure 9)

![Figure 9. The X-Ray panel](image)

In the left side there are some input field to store the diagnosis (Scoliosis, Scheuermann), the type of illness the Lenke classification\(^2\) factor and other data of vertebras (Cobb angle, rotation\(^3\)).

With help of a special function there is a possibility to analyze X-Ray pictures. On the Figure 10 there are some moveable line segments there with moveable endpoint of A, B, C, D, E, F and G. Of course the picture can be zoomed and rezoomed.

![Figure 10. Analysis of X-Ray picture](image)
The angle between the AB and CD sections defines the Cobb angle, and E, F and G sections defines the rotation, depend on the F (Figure 11).

![Figure 11](image)

**Figure 11.** The Cobb angle \(a,\) and the rotation \(\%\) \(b,\)

### 2.4.3 Hip movement

On the Hip movement panel the user can define a lot of test data as we can see on the Figure 12.

![Figure 12](image)

**Figure 12.** Hip movement data

### 2.4.4 Moiré (Kinect) analysis

Either on the traditional moiré \(^4\) pictures or Kinect procedure \(^5\) there is a possibility to measure POTSI (POsterior TrunkSymmetry Index \(^6\)) visible in Figure 13, or the Gerinco2 project evaluated Prediag method \(^7\) visible on Figure 14.
